

In a **PDF document called project_part1.pdf**, provide a list of at least three different data sources that you think could be a great fit for the Quantified Self project. For each data source, provide the following information:

1. Is the data source automatic or manual?
2. How will the data be collected? If this is an automatic data source, provide a screenshot of example data you are able to download.
3. At what interval is the data collected? (e.g. minute-by-minute, daily, at each meal, etc.)
4. What are different attributes/dimensions of the data? For the Fitbit example, this would be steps, heart rate, calories burned, sleep levels, etc.)
5. Why are you interested in this data source and what would you hope to learn from your analysis of your own data collected from it?

Response: Three Data Sources

Data Source One: Tracking time spent each week with my various hobbies

1. This data source would be manual.
2. I would record in a spreadsheet grid what hobbies I do on what day, and how long I spend doing them. I would record in minutes to make data analysis easier.
3. Data is collected daily.
4. The data would track what days I engage with my hobbies, what hobbies, and how much time I spend on each.
5. From what I can tell, I spend a lot of time on hobbies, mostly just because I have a lot of them I've picked up over the years. I would like to see which hobbies I spend the most time on, and how much time in general I dedicate to my hobbies. I think it would also be interesting to see what days I most often have time for hobbies.

Data Source Two: Apple watch data

1. This data would be automatic.
2. I would export my health data from the Apple Health app because it's connected to my apple watch.
3. It's collected minute by minute.
4. It would collect heart rate, calories burned, minutes spent working out, steps, hours standing, and data from when I've gone skiing.
5. I used to be a runner in high school, so I spent a lot of time tracking my health data then. I would like to see how my heart rate varies, and track my workout habits. This

is kind of a silly reason, but my school/ work schedule is pretty chaotic, so my workout habits are pretty sporadic, so I honestly think tracking them would make me more motivated.

Data Source Three: Tracking financial habits

1. This data source would be manual.
2. I actively keep a spreadsheet of money I spend and earn, so I would get my data from here.
3. This data is collected month by month.
4. The main dimensions are earnings and spendings and I also include where the money comes from/ to.
5. I've spent a lot more of my time organizing, budgeting, and planning with my money as I've become more financially independent. I think it would be helpful to visualize my money habits because just having the numbers sometimes isn't very helpful.
